

University of Sahiwal – Single Page Website Project

Student Name: Rabiya Fatima

ID: 650152

Class: 1_WT-FED-U-F08

Trainer: Muhammad Umar Sajid

1. Introduction

In this project, I created a single-page website for the University of Sahiwal using HTML and CSS. The purpose of this project was to improve the design and structure of the existing university website and make it cleaner, more organized, and user-friendly.

Before starting coding, I carefully observed the original website and noticed that some sections looked crowded and not well structured. My goal was to redesign it in a simple and professional way using the concepts we learned in class.

2. Planning Process

Before writing code, I planned the layout of the website. I decided the order of sections such as:

- Header and Navigation
- Hero Section
- About Section
- Events Section
- News Section
- Departments & Programs
- Scholarships
- Faculty
- Accreditations

- Footer

I focused on keeping proper spacing and alignment so the website does not look messy.

3. Design Improvements

Compared to the original website, I made the following improvements:

- Used a clean green color theme instead of mixed colors
- Added proper spacing between sections
- Used card layouts for events, news, and departments
- Made the navigation simple and clear
- Organized content in grid format
- Made the design more balanced and modern

My design is more structured and easy to read.

4. HTML Structure

In this project, I used proper semantic HTML tags such as:

- `<header>` for the top section
- `<nav>` for navigation menu
- `<main>` for main content
- `<section>` for different parts of the page
- `<article>` for cards like news and events
- `<footer>` for bottom section

I also added proper `<title>` and `<meta>` tags inside the head section for basic SEO.

5. CSS Implementation

I used an external CSS file to style the website. I did not write CSS inside HTML.

In CSS, I applied:

- Flexbox and Grid for layout
- Consistent margins and padding
- Hover effects on buttons and cards
- Clean fonts and readable text sizes
- Media queries for basic responsiveness

I kept the CSS simple and well organized.

6. Challenges Faced

During the project, I faced some challenges such as:

- Adjusting spacing properly
- Making the layout look balanced
- Aligning cards equally
- Managing image sizes

But I solved these issues by practicing and testing different CSS properties.

7. Conclusion

This project helped me understand how to structure a complete single-page website using HTML and CSS. I learned how to organize sections properly, improve design clarity, and apply semantic tags and SEO basics.

Overall, I tried my best to create a clean and professional improved version of the University of Sahiwal website
